Alferov Zh. I. *Perspectives of Electronics Development in Russia are Considered* 2

Perspectives of electronics use, which is the most rapid developed global scientific-technical direction are considered.

Boreskov G. K. *Perspectives of Science Development in Russia are Considered* 19

Perspectives of Science use, which is the most rapid developed global scientific-technical direction are considered.

Baturin A. S., Chouprik A. A., Sheshin E. P. *Lateral Force Microscopy: Quantitative Approach* 23

Atomic force microscope allows investigating frictional properties of surfaces. However obtained maps of lateral force (LF) distribution are qualitative. Experimental method of calibration presented in this paper allows quantitative interpretation of LF microscopy results. The information about cantilever and construction of optical detection system is required for calibration. Moreover, subsidiary calculations should be done only once for each model of microscope.

Dedkov G. V., Kyasov A. A. *Interaction of Moving Neutral Nanoparticle with the Equilibrium Background Radiation in Vacuum* 28

For the first time, the fluctuation electromagnetic force and heating rate of a neutral polarizable nanoparticle moving with an arbitrary velocity V relative to the equilibrium background radiation of arbitrary temperature are calculated at $R \ll \lambda_W$, where

R and λ_W are the particle radius and Wien wave length of the radiation. The particle is characterized by an isotropic polarizability. General formulas for the force, acting on and the rate of heating the particle in the field of background radiation are derived. The results are of interest for nanoelectrodynamics, particle trapping and physics of dust matter in astrophysics.

Kartashev V. A., Buruhina T. F. *Dependence of Tip Displacements from Nonresonance Oscillation of STM Basis* 31

Mathematic model of dependence between tip displacements and nonresonance oscillation of STM basis is investigated. This dependence takes place due to gap of STM structure under gravity and changing of its vector when STM axis swings in flexible bracket. In low frequencies contribution of this effect can be more then contribution of translation oscillations which usually take into account in developing of bracket.

Belyanin A. F., Samoylovich M. I., Jitkovsky V. D., Pashchenko P. V., Timofeev M. A., Kovalskij K. A., Kleshcheva S. M., Borisov V. V., Petukhov K. Yu. *Layer Cold Cathodes* 39

The conditions of formation, structure and functional properties of diamond and diamond-like films applicable for layer cold cathodes preparation are considered. The exploitation characteristics of layer structures (including nano-structured diamond and diamond-like material layers) are shown as cold cathodes for emission electronic devices.
